RECORD-BREAKING HEAT IN EUROPE

Increased demand for air conditioning maintenance and repair services

The record-breaking temperatures experienced across Europe during 2026 significantly increased demand for air conditioning maintenance and repair services.

Prolonged heatwaves, with temperatures exceeding 40°C have been registered in nearly all European countries. Independent workshops and dealer service networks reported substantially higher workloads during the spring and summer months. Growing consumer awareness of cabin comfort and safety further boosted demand for air conditioning inspections and refrigerant recharging.

The 2026 season demonstrated that extreme weather is becoming a noteworthy driver of aftermarket service demand. Air conditioning service is increasingly evolving from a seasonal activity into a strategic business area requiring skilled technicians, efficient equipment and focused investment in advanced diagnostic equipment.

Snap-on Climate Solutions is proud to confirm again it's further growing leading position.

DATABASE UPDATE R744

New Database version for R744 refrigerant is available

Airconditioning systems with R744 refrigerant (CO2) are implemented in a constantly growing number of models. Audi, Mercedes-Benz and Volkswagen further grow in different models, while Cupra, Ford and Skoda implemented new models.

With the most recent software update (30p07p04) please find included also the Database update with these new models.
